

OZpolish O2

Highlight

OZpolish O2 is in powder form which gradually & slowly dissolve oxygen to water for hours thus maintains the Biological Oxygen Demand (BOD) in aquarium water.

OZpolish O2 is meant to use during a situation when 'any or all' air-pump/ Filter/ Wave Maker is not available or is not functional. In a situation the Oxygen level in water depletes due to reduced or no water surface turbulence, OZpolish O2 is the aquarium savior.

OZpolish O2 is easier to use while transporting the live fishes or while working on aquarium maintenance for hours with fishes in a tank with no provision of air exchange to maintain the BOD. It is recommended to keep in stock for a situation of unforeseen tank's low oxygen disaster. Replace approx 10% of water before turning back on to an air pump.

OZpolish O2 is safe to use in case of invertebrates (shrimps, snails etc.), plants, other terrestrial pets and human. However, increased oxygen level in tank water is known to kill Cyanobacteria/ Blue Green Algae (BGA). This is another benefit, which makes OZpolish O2 the ideal BGA contender. To combat BGA, sprinkle a little OZpolish O2 over the infected areas. Repeat this every 2-3 day till there is no presence of BGA in the tank. Water Change after every treatment.
